

Dictation Contest (PRJr, 初級) No. 217

Hello, everyone! How are you?

Welcome to PR Junior! Today is part two of *Monsters University*.

At the final scare test, Mike roars at Sully. Sully roars at Mike. Sully breaks the dean's scream can. She kicks them out of the scaring program. Mike and Sully join the Oozma Kappas. They enter the Scare Games as a team. The winners will get into the scaring program. The Oozma Kappa team wants to win.

Okay, and that's it for today. I'll see you guys [in the] next video, okay? Bye!

Dictation Contest (PR1, 中級) No. 217

Hi, guys! Welcome to PR1.

Today, we will be reading a story from Buntan Three. Let's start!

My favourite subjects in school are math and science. I like them a lot, but most students in my class don't like them. It feels good to get the right answers on homework problems. I passed all of my math and science exams last year with really high scores. My friends were impressed. Now, I often help them with their homework. I'm very proud that they want my help. I hope they can get high scores on their tests, too.

Okay, that's it for today. What are your favourite subjects in school?

See you next time!

Dictation Contest (PR2 上級) No. 217

Hey, guys! How are you doing?

Hope you're all still staying healthy and safe.

I have another news story for you here coming from the world of nature and science, so take a listen to this:

Scientists have unearthed massive 98-million-year-old fossils in southwest Argentina that they say may have belonged to the largest dinosaur ever discovered. Human-sized pieces of fossilized bone belonging to the giant sauropod appear to be 10 percent to 20 percent larger than those attributed to *Patagotitan mayorum*, the biggest dinosaur ever identified, according to a statement January 20th from the National University of La Matanza's CTYS scientific agency. Sauropods were enormous long-necked, long-tailed, plant-eating dinosaurs – the largest terrestrial creatures to ever have lived. Among them, *Patagotitan mayorum* weighed in at about 70 tons and was 40 meters long.

Wow! I feel like I learn new things about dinosaurs every day – or rather that the things I thought I knew were wrong. To my knowledge, the largest dinosaur to have ever lived was a sauropod called *Argentinosaurus*. But the fact that that dinosaur and these ones were discovered in the same part of the world might suggest that they're closely related. Interesting stuff!

Or is it? Let me know what you think, okay?

Alright, guys, well until next time – and as always – study hard, stay safe, and I'll see you soon.
