

Dictation Contest (PRJr, 初級) No. 841

Hello, guys! Welcome back to PR Junior.

Today, I will talk about the dentist.

Sara loves sweets, but one day she got a toothache. The tooth hurt so much that she only drank warm milk that night. Sara's mother took her to the dentist the next day. Sara was afraid of dentists, because she thought they were scary. Sara was upset all the way to the clinic.

That is all for today. See you!

Dictation Contest (PR 1, 中級) No. 841

Hi, everyone! Welcome to PR1.

Today we'll be reading a letter about a job interview. Take a listen.

Dear Mr. York,

Thank you for your interest in the database manager position. This position is responsible for managing and organizing the company's critical data, which includes customer information. As described in the job advertisement, this job requires accuracy and a good knowledge of the overall system as well as each database in detail. We looked over your application documents, and as a qualified applicant, we would like to have an interview with you. The days available for an interview are as follows. As you can see, they are quite limited, so we strongly recommend that you make a reservation as soon as possible. We look forward to hearing from you soon.

Okay, that's it for now. Bye!

Dictation Contest (PR2 上級) No. 841

Hi, everyone! Welcome back to PR2.

This is the first half of a text, which talks about the shifting relationship between humans and computers. Let's see what it has to say!

The bond between humans and computers is becoming more intimate than ever before. Scientists are now putting microchips inside people's bodies. They are made up of compressed electrical circuits that can detect and record data about the body. They are tiny, but they hold the equivalent amount of data as most computers.

A microchip is put to use inside a person with a simple procedure. First, a doctor must put data about the patient onto a chip. Input about the person's age, race, gender, and medical history is stored on the chip. The second phase of the process involves putting it in the person's skin. The doctor pinches a piece of skin and cuts a tiny hole with a tool shaped like a spiral. The chip is inserted, and the skin is allowed to heal. At last, it begins the task of putting data into its database.

That was all for the first part. I think that there are definitely some people who are opposed to this practice. What about you? Let me know your thoughts during our next PR class. For now, take care and I will see you then! Bye-bye!
